## WATCHLIST TECHNICAL SUMMARY (SET)

Generated automatically on 2026-06-11 11:51:36 (Thailand Time)

| Ticker    | Cost   | Price  | Support | Resist. | OBV     | MACD              | Trend    | Rec. | Important Note (THB Context)                                                                                                                                                                                                                                                                                                   |
|-----------|--------|--------|---------|---------|---------|-------------------|----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADVANC.BK | 370.62 | 360.00 | 349.00  | 372.00  | Falling | Bullish Crossover | Sideways | Hold | The position is currently unprofitable (-10.62 THB). However, the price is consolidating well above the 1-month support floor of 349.00 THB. A recent bullish MACD crossover (0.81 vs. 0.80) suggests a momentum trend reversal may be starting, justifying a defensive Hold to allow the technical recovery floor to firm up. |
| AOT.BK    | 55.00  | 56.50  | 52.00   | 59.00   | Falling | Bullish Territory | Sideways | Sell | Although the position is profitable (+1.50 THB) and the MACD remains in Bullish Territory, the OBV trend is Falling. According to our risk management rules, this volume divergence indicates buying exhaustion, triggering an active Take-Profit Sell to protect open capital.                                                |
| BBL.BK    | 168.45 | 170.00 | 163.00  | 176.00  | Falling | Bearish Territory | Bearish  | Sell | With the position in a profitable state (+1.55 THB), the combination of a falling OBV trend and the MACD residing in Bearish Territory indicates severe momentum deterioration. We downgrade to Sell to lock in remaining open profits before further downside exposure.                                                       |

## WATCHLIST TECHNICAL SUMMARY (SET)

Generated automatically on 2026-06-11 11:51:36 (Thailand Time)

| Ticker  | Cost  | Price | Support | Resist. | OBV     | MACD              | Trend   | Rec. | Important Note (THB Context)                                                                                                                                                                                                                                                                                                             |
|---------|-------|-------|---------|---------|---------|-------------------|---------|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GULF.BK | 57.92 | 64.25 | 59.00   | 68.50   | Falling | Bearish Crossover | Bearish | Sell | A highly profitable trade (+6.33 THB) that must now be closed. The appearance of a Bearish MACD Crossover combined with a Falling OBV trend signals that upward momentum has completely exhausted. Capital preservation rules dictate a Sell recommendation to secure gains.                                                             |
| PRM.BK  | 8.70  | 8.20  | 7.95    | 9.05    | Falling | Bearish Territory | Bearish | Hold | The position is currently unprofitable (-0.50 THB). While both MACD and OBV remain weak and bearish, the recent price trend has established a short-term consolidation floor at 8.20 THB, holding just above the 1-month support of 7.95 THB. We maintain a defensive Hold, but will exit immediately if the 7.95 THB level is breached. |
| KTB.BK  | 32.53 | 34.75 | 33.00   | 35.75   | Falling | Bearish Territory | Bearish | Sell | Currently holding a profit of +2.22 THB. However, the technical picture has deteriorated with a Falling OBV and MACD in Bearish Territory. To prevent profit erosion, we execute our trailing exit rule and downgrade to Sell.                                                                                                           |

## WATCHLIST TECHNICAL SUMMARY (SET)

Generated automatically on 2026-06-11 11:51:36 (Thailand Time)

| Ticker | Cost   | Price  | Support | Resist. | OBV     | MACD              | Trend    | Rec. | Important Note (THB Context)                                                                                                                                                                                                                                                    |
|--------|--------|--------|---------|---------|---------|-------------------|----------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PTT.BK | 32.12  | 36.50  | 36.00   | 37.25   | Falling | Bearish Territory | Sideways | Sell | The position is highly profitable (+4.38 THB). However, because the OBV is Falling and the MACD has slipped into Bearish Territory, buying interest has cooled. We must downgrade the recommendation to Sell to protect the accrued capital gains.                              |
| SCB.BK | 143.38 | 138.00 | 131.00  | 141.50  | Falling | Bullish Territory | Sideways | Hold | The position is unprofitable (-5.38 THB), but the price action has firmed up at 138.00 THB, well above the key 1-month support at 131.00 THB. Backed by a positive MACD in Bullish Territory (0.91 vs. 0.54), we Hold to allow the structural recovery to play out.             |
| WHA.BK | 4.87   | 5.00   | 4.52    | 5.20    | Rising  | Bearish Territory | Sideways | Sell | The position is profitable (+0.13 THB) and the OBV is Rising. However, the MACD is currently in Bearish Territory (0.11 vs. Signal 0.13), indicating a negative momentum shift. Under our strict risk rules, this bearish momentum crossover triggers a Sell to secure profits. |
